

Number Guessing Game

A simple console-based number guessing game built in Java. The program picks a random number between 1 and 100, and the player has a limited number of attempts to guess it correctly.

How It Works

- The computer randomly selects a number between 1 and 100.
- The player enters guesses through the console.
- After each guess, the program responds with:
 - **Too low!** — if the guess is smaller than the number
 - **Too high!** — if the guess is larger than the number
 - **Correct!** — if the guess matches, along with the number of attempts used
- The player has **7 attempts** to guess correctly.
- If all attempts are used without a correct guess, the game reveals the number.

Requirements

- Java Development Kit (JDK) installed
- Any code editor or terminal (VS Code recommended)

How to Run

1. Clone this repository:

```
git clone
https://github.com/yourusername/number-
guessing-game.git
cd number-guessing-game
```

2. Compile the program:

```
javac NumberGuessingGame.java
```

3. Run the program:

```
java NumberGuessingGame
```

4. Follow the on-screen prompts to play.

Example

```
I'm thinking of a number between 1 and 100.
You have 7 attempts to guess it!
Enter your guess: 50
Too high!
```

```
6 attempts left.  
Enter your guess: 25  
Too low!  
5 attempts left.  
Enter your guess: 37  
Correct! You guessed it in 3 attempts.
```

Future Improvements

- Add difficulty levels (adjust range and attempts)
- Track and display best scores
- Build a GUI version using Swing
- Add a "computer guesses your number" mode
